

DDL4 produced potable water storage information.

The water produced with the carafe, if sealed and stored, not subjected to light and at a controlled temperature, is kept like normal packages of water found in the supermarket.

We do not have certain indicated conservation data, given that storing water for a long time is not the recommended use.

It must be said that the carafe itself must be used frequently, because if the filter remains dry (i.e. does not filter) it tends to deteriorate more quickly.

Therefore, water must be produced, this is our advice, daily as needed.

NOTE: if the water is stored outside the fridge, the advice is not to exceed 72 hours, as at an ambient temperature of 20 degrees, outside the fridge, the state of degradation of the water tends to increase over time (to be clear, stale water tends to smell bad over time).
